

Fabrika Cementa Lukavac

Opis radova na gradilištu

Zaštita jama na novim proizvodnim postrojenjima tvornice cementa. Jame su zaštićene čeličnim žmurjem ARBED AU 16 duljine 13 m koje su razuprte čeličnim razuporama. Zabijanje i vađenje žmurja bilo je veoma zahtjevno iz razloga raznolike geologije (zabijanje kroz glinovite slojeve sa ostacima drvenih konstrukcija ugljenokopa). Radove smo izvršili na osnovu naše vlastite projektne dokumentacije.

FCL Lukavac pitt protection

Contrakt description

Pit protection at a new production installation of a cement factory. Pits are protected with steel sheet piles ARBED AU 16 of 13 m in length, spread with steel spreaders. The installation and removal of the sheet piles were rather demanding because of the geological variety (ramming was carried out through clay layers with remains of wooden constructions previously used for coal mining). Works were carried out according to our own project documentation.
